

10 Steps to a Professional Air Duct Cleaning

FRESH AIR CORP
614-322-3828

Step 1. Protection

Job one at Fresh Air Corp is the protection of your home and property. We begin by placing a heavy vinyl tarp over your driveway.

Step 2. Complete Set-Up

Work will not begin until the floors, doorways and corners are protected against dirt or scratching. Protective shoe covers are worn at all times.

Step 3. Negative Air Pressure

The large 8" vacuum hose is attached to both the supply and return sides of the system. During the cleaning process, all dirt and debris is drawn out to our industrial vac-truck.

Step 4. Hand Cleaning

The metal box under the floor register is called a "stack-boot." We spray a degreasing agent and hand clean each one with a cotton towel.

Step 5. Maximizing Vacuum

All registers are covered with a magnetic-vinyl sheet. As each run is cleaned the cover is removed, maximizing the air flow inside that duct line.

Step 6. Scrubbing the System

Pulling large volumes of air toward the truck, we now feed our soft rubber, high air pressure scrubbing tools down each supply line. This removes every trace of dirt, and hair.

Step 7. Cold Air Returns

After all the supply runs are cleaned, we move to the cold-air return system. This includes all the grill covers and drops in the structure.

Step 8. Trunks & Plenums

All trunk lines (supply) and plenums (return air) are cleaned with our special scrubbing tools. Specially designed plastic plugs insure there's no air flow loss.

Step 9. Furnace Interior

This optional step is completed with the removal of both furnace panels and the cleaning of the blower fan, combustion chamber, electric motor and cabinet.

Step 10. Wrapping It Up!

New galvanized access panels are installed over the openings created for the vacuum hose. Floors are swept clean and all debris is removed.
